#### 4<sup>th</sup> ICRMCE 2018

Application of NDT Apparatus for Possible Use as Structural Health Monitoring of Concrete Building in the Field

#### Akmaluddin Ni Nyoman Kencanawati Ahmad Gazi Paedullah

Postgraduate Study Program of Civil Engineering Faculty of Engineering University of Mataram Jl. Majapahit 62 Mataram 83125, Indonesia

# INTRODUCTION

- METHODOLOGY
- RESULTS AND DISCUSSION
- CONCLUSION

# OUTLINE

# Introduction

- Errors in the process of construction work due to low-quality control
- Extreme load on the building caused by natural disasters such as earthquakes; and
- Insufficient data for evaluating purposes if the building function is to be improved.

Doubts arise about the ability of building's serviceability

a non-destructive test (NDT) on the existing building structure is required

## Background

This study is aimed to develop models for interpreting the residual strength of concrete structures in the field when the material quality and structural condition of the structure are questionable

## **Objective**

# METHODOLOGY

#### **1. Pundit plus**

#### 2. Schmidt Hummer

## **Apparatus used**

#### **3. Flexural test equipment**

## 4. Compression test equipment

### **Apparatus used**

|                                    | Aggregates |                     |  |
|------------------------------------|------------|---------------------|--|
| Description                        | Sand       | Course<br>aggregate |  |
| Unit weight (gr/cm <sup>3</sup> )  | 1341       | 1451                |  |
| Bulk density (gr/cm <sup>3</sup> ) | 1.520      | 1.646               |  |
| Fineness modulus                   | 3.203      | 6.67                |  |
| Mud content (%)                    | 3.06       | -                   |  |
| Specific gravity (SSD)             | 2.65       | 2.56                |  |

## **Material properties**

| Description                 | Compressive strength (MPa) |      |      |  |
|-----------------------------|----------------------------|------|------|--|
| Description                 | 25                         | 35   | 45   |  |
| Water to cement ratio       | 0.56                       | 0.48 | 0.43 |  |
| Cement (kg/m <sup>3</sup> ) | 360                        | 427  | 466  |  |
| Water (kg/m <sup>3</sup> )  | 205                        | 205  | 205  |  |
| Sand (kg/m <sup>3</sup> )   | 740                        | 713  | 693  |  |
| Gravel (kg/m <sup>3</sup> ) | 1110                       | 1070 | 1040 |  |

### **Concrete mix proportions**

\*) Reference [10]

**Comparison of structure condition on the bases of pulse velocity with a different approach** 

- The value of v is directly proportional to the load and inversely proportional to the residual strength.
- Concrete structures with a residual strength of more than 60% are considered healthy or in a structurally "good" condition.
- Also, the concrete structure is healthy when the v measured gives a value of 3.5 and above. This value is acceptable and lies within the v range of 3.5 – 4.5 given in the reference

## CONCLUSIONS
